

Automated Deployment Pipeline

SkyBridge Network Recovery Optimizer

Name	
GitHub repository	https://github.com/MayFairMI6/skybridge-network-recovery-optimizer

Completed requirements

Requirement	Verification
Git/GitHub	Complete. The repository contains the application, Dockerfile, Jenkinsfile, Terraform configuration, Jenkins Docker setup, and documentation.
Automated CI Trigger	Complete. SCM polling H/2 * * * * detected a GitHub push and automatically started successful Jenkins build #46; Build Now was not used.
Jenkins (Builder)	Complete. Jenkins checks out the repository, builds a Docker image, and runs terraform apply.
Terraform (Deployer)	Complete. Terraform uses the kreuzwerker/docker provider and the local Docker socket to create or replace the application container.
Docker (Runtime)	Complete. Docker Desktop hosts both Jenkins and the deployed SkyBridge application.

Local setup and verification

The project runs locally on macOS using Docker Desktop. Jenkins runs as the local-pipeline-jenkins Docker container and is configured in a Docker-outside-of-Docker pattern: the Docker Desktop socket is mounted into Jenkins so the Jenkins Docker CLI and Terraform Docker provider can manage the host daemon.

The deployed SkyBridge dashboard is a stochastic airline disruption-recovery simulation. It evaluates flight holds, cancellation/rebooking, hotel protection, recovery inventory, passenger priority, airport-pair slot pressure, weather, airspace, and volcanic-ash signals. It is a classroom prototype using synthetic network and passenger data, not a production airline system.

Verification sequence: start Docker Desktop; run Docker Compose from the repository root; open Jenkins at <http://localhost:8080>; run the Pipeline job; confirm a successful console log; verify local-pipeline-app is deployed to port 8081; then open <http://localhost:8081> and capture the running dashboard.

Captured verification evidence

The following pages contain unedited screenshots captured from the local environment. They show successful Jenkins builds, Terraform deployment, Docker runtime evidence, and the deployed application.

1. Jenkins build history

The screenshot shows the Jenkins web interface at localhost:8080/view/all/builds. The left sidebar contains a 'New Item' button, a 'Build History' button, a 'Build Queue' section (showing 'No builds in the queue.'), and a 'Build Executor Status' section (showing '0 of 2 executors busy'). The main area is titled 'Build History of Jenkins' and displays a table of build records.

S	Build	Time Since	↑	Status	
✓	skybridge-network-recovery-optimizer #43	2 min 22 sec		stable	[icon]
✓	skybridge-network-recovery-optimizer #42	2 min 35 sec		stable	[icon]
✓	skybridge-network-recovery-optimizer #41	7 min 46 sec		stable	[icon]
✓	skybridge-network-recovery-optimizer #40	12 min		stable	[icon]
✓	skybridge-network-recovery-optimizer #39	12 min		stable	[icon]
✓	skybridge-network-recovery-optimizer #38	16 min		stable	[icon]
✓	skybridge-network-recovery-optimizer #37	18 min		stable	[icon]
✓	skybridge-network-recovery-optimizer #36	22 min		stable	[icon]
✓	skybridge-network-recovery-optimizer #35	22 min		stable	[icon]

Successful Jenkins build history for the SkyBridge Pipeline job.

2. Jenkins console output

Terraform created local-pipeline-app:43, published port 8081, and the pipeline finished successfully.

3. Docker runtime

Docker Compose starts local-pipeline-jenkins; docker ps confirms Jenkins is running on ports 8080 and 50000.

4. Running deployed application

The screenshot displays the SkyBridge Network Recovery Optimizer web application. The browser address bar shows `localhost:8081`. The application interface includes a flight path selector at the top with buttons for **SFO**, **DXB · constrained hub**, **LHR**, and **DEL**. Below this, a text block explains the optimizer's evaluation of weather events, hub capacity, and revenue. A green status bar indicates: "Open-Meteo: 35° · gusts 8 mph · visibility 18 km · cloud 90% · precipitation 0 mm", "Automatic forecast: weather 35% · news/airspace 0% · volcanic ash 0% — dominant risk: none", and "Airspace monitor: no material closure or rerouting signal for DXB".

Summary statistics are shown in three boxes: **Affected flights: 6**, **Protected itineraries: 14**, and **High-risk connections: 12**. To the right, there are sliders for **Risk aversion** (set to 55% tail-risk weight) and **Weather severity** (set to 11% multi-variable weather risk). Below these are dropdown menus for **Disrupted legs** (showing LHR-DEL, SIN-HKG, SYD-AKL), **Route origin** (SFO), **Connection after hub** (LHR), and **Final destination** (DEL). A prominent blue button reads **Run stochastic recovery optimization**. Below the button, a note states: "Every run resamples weather duration, connection failures, recovery-seat availability, cancellations, reroutes, and new-demand revenue."

The bottom section, titled **Network action recommendation**, features a green box with the recommendation: **Recommend: Hold 90 minutes**. It explains that for the DXB disruption scenario, this policy has the lowest risk-adjusted network cost at **\$56,657**, protecting an expected **39 of 46 itineraries**. Below this is a table comparing candidate policies:

CANDIDATE POLICY	EXPECTED COST	95TH PERCENTILE	RISK-ADJUSTED SCORE	PROTECTED ITINERARIES	DECISION
Hold 90 minutes	\$45,081	\$61,780	\$56,657	39.5 / 46	Recommended
Hybrid: protect long-haul, rebook others	\$73,171	\$85,750	\$81,983	29.7 / 46	Alternative
Cancel + same-day rebook	\$80,967	\$94,862	\$89,861	20.7 / 46	Alternative

SkyBridge Network Recovery Optimizer running locally at `http://localhost:8081`.
